SINGAPORE SCIENCE & ENGINEERING FAIR (SSEF)

BACKGROUND

The Singapore Science & Engineering Fair (SSEF) is a national competition organised by the Ministry of Education (MOE) and Science Centre Singapore. The fair is open to all secondary and pre-university students between 15 and 20 years of age. Participants submit research projects on science, technology, mathematics and engineering. At the project exhibition in the fair, participants are interviewed by judges from organisations and institutions including local universities, polytechnics and research institutes.

The SSEF is affiliated to the highly prestigious Regeneron International Science and Engineering Fair (Regeneron ISEF), which is regarded as the Olympics of science competitions.

SSEF 2024

2024 marks the 24th year of the Singapore Science and Engineering Fair (SSEF). SSEF 2024 continues to see high levels of participation with 550 projects registered for the Main Category. 319 of these projects were shortlisted for Final Judging in March 2024. A total of 117 Main Category awards were given out, comprising 27 Gold, 28 Silver, 36 Bronze and 26 Merit. This year, thirteen organisations (Amgen; ARTC-SIMTech; Institute of Chemical Engineers, Singapore; James Dyson Foundation; L'Oréal Groupé; NUS Chemistry; Singapore Association for the Advancement of Science; Singapore Mathematical Society; Singapore Society for Microbiology and Biotechnology; Singapore University of Technology and Design; The Electrochemical Society, Singapore Chapter; Institute of Engineers, Singapore; Yale-NUS college) sponsored 18 Special Awards, which were awarded to 76 projects.

In the Junior Scientist category (for students under 15 years of age at the period of experimentation), 67 projects were registered, and 31 projects were shortlisted for Final Judging. Five projects were awarded Distinction and three were awarded Merit for overall content and poster presentation. All 67 projects were eligible to participate in the Junior Scientist Video Contest out of which three were awarded Distinction and another three were awarded Merit for their videos.

FOREWORD

Mr Teo Kok Hong

CHAIRPERSON, *Singapore Science & Engineering Fair Working Committee 2024*
DIRECTOR, *Sciences Branch, Curriculum Planning and Development Division, Ministry of Education*

The Singapore Science and Engineering Fair (SSEF) continues to gather traction since returning to an in-person format in 2023. SSEF has grown stronger with an increasing number of schools and organisations participating over the years. Representatives from various organisations, ranging from research institutions to industry partners and the general public had the opportunity to engage students and learn more about these budding scientists' research innovations. Students, judges and visitors absorbed in scientific discourse was a sight to behold at every SSEF. We look forward to this continued zest and interest in STEM and research, and hope to celebrate the good effort by all present and past students with the upcoming SSEF Silver Jubilee in 2025.

SSEF is an important platform that brings together students, educators, researchers and industry professionals to learn about, share and collaborate on STEM research. We see our students developing into

adaptive thinkers and creative problem-solvers as they learn new skills, sharpen their thinking and enrich their perspectives of STEM-related fields. We are confident that our students will be able to anticipate and address future challenges, and are motivated to make positive changes to society for a better future.

This year, 1399 students from 51 schools submitted 617 research projects for the fair. A total of 117 projects received Gold, Silver, Bronze and Merit Awards. To all student participants, we are proud of what you have accomplished! With the positive feedback received for past years' fringe activities offered by our partner organisations, SSEF has continued to expand the variety of activities this year. This year's SSEF Public Day comprised ten unique hands-on activities by valued partners and four STEM talks offered by our sponsor organisations, alongside the showcase of research projects by student finalists. The interest and response from schools and the public continues to be strong with at least 2000 visitors on SSEF Public Day this year. We were heartened by the strong show of support for our student finalists and the increasing interest in STEM from our schools and the public.

SSEF 2024 would not be possible without the invaluable support from the various members of our STEM community. I would like to express my deepest gratitude to the teachers, research mentors and judges for your valuable time, effort and expertise in developing our young talents. I would also like to thank our partner organisations for sponsoring the Special Awards to recognise our students' efforts to advance research. The 13 organisations are Amgen, ARTC-SIMTech, Institute of Chemical Engineers, Singapore, James Dyson Foundation, L'Oréal Groupé, NUS Chemistry,

Singapore Association for the Advancement of Science, Singapore Mathematical Society, Singapore Society for Microbiology and Biotechnology, Singapore University of Technology and Design, The Electrochemical Society, Singapore Chapter, Institute of Engineers, Singapore and Yale-NUS college. Finally, I would like to thank our sponsors, A*STAR Graduate Academy, Defence Science and Technology Agency (DSTA), DSO National Laboratories, and Home Team Science and Technology Agency (HTX), and our longstanding co-organiser, Science Centre Singapore for the support and dedication in ensuring an enriched STEM learning experience for our students.

We look forward to your support for the upcoming SSEF Silver Jubilee in 2025. Let us ride on the wave of change and continue to be Curious, be Creative and be a positive agent of Change!

Mr Teo Kok Hong

CHAIRPERSON, *Singapore Science & Engineering Fair Working Committee 2024*
DIRECTOR, *Sciences Branch, Curriculum Planning and Development Division, Ministry of Education*

FOREWORD

Associate Professor Lim Tit Meng

FAIR DIRECTOR
CO-CHAIRPERSON, *Singapore Science Engineering Fair Working Committee 2024*
CHIEF EXECUTIVE, *Science Centre Board*

This year marks the 24th anniversary of the Singapore Science & Engineering Fair (SSEF), jointly organised by the Ministry of Education (MOE) and Science Centre Singapore (SCS). SSEF provides an excellent platform to showcase the passion of our budding scientists and engineers to industry experts. The winners will have the opportunity to represent Singapore at the prestigious International Science and Engineering Fair (ISEF), considered the Olympics of science competitions.

Candidates with outstanding research projects from SSEF 2024 can further compete in the National STEM Talent Search (NSTS), an annual competition designed to motivate and accord national recognition to students who excel in STEM. Following a rigorous selection process, only the best nine progress to the final round. They will be evaluated by an esteemed panel of judges chaired by Professor Phoon Kok Kwang, Provost of Singapore University of Technology

and Design (SUTD), and together with Chief Judge Professor Ng Huck Hui, Assistant Chief Executive for Research and Talent Development, and Chief Scientific Advisor of the Institute of Molecular and Cell Biology (IMCB), under the Agency for Science, Technology and Research (A*STAR).

Competitions such as SSEF & NSTS provide a platform for youth to showcase their projects and an opportunity to work with professional mentors on their research. This immersive learning opportunity offers excellent insights for our youth and helps ignite their passion to pursue a career in STEM.

SSEF continues to draw strong interest from students in Singapore with more than 1000 students submitting 617 research projects this year. Of these, 69 projects were submitted for NSTS 2024 and competed for the top nine positions. I am extremely heartened by the enthusiasm and determination of the students and look forward to seeing their projects showcased at the awards ceremony on 30 April.

My sincere gratitude to all judges, mentors, trainers, teachers, parents and officials involved in this meaningful journey. On behalf of the Centre, I would especially like to thank MOE for their support, our sponsors and partners. Together through this initiative, we will continue to nurture the scientists of tomorrow.

Associate Professor Lim Tit Meng

FAIR DIRECTOR
CO-CHAIRPERSON, *Singapore Science Engineering Fair Working Committee 2024*
CHIEF EXECUTIVE, *Science Centre Board*

SSEF 2024 WINNERS

GOLD

Aaron Jacob, Possaweekrish Wipasstharitsakul
VICTORIA JUNIOR COLLEGE, HWA CHONG INSTITUTION
Analysis and Modelling of Eutrophication using System Dynamics

Akshat Vijoy
NUS HIGH SCHOOL OF MATHEMATICS AND SCIENCE
Comprehensive Modelling and Dynamical Analysis of Magnetic Braking in Rotating Conductive Spheres for Space Debris Mitigation

Ang Gedeon Kusuma
RAFFLES INSTITUTION
SMART (Sustainable, Modular, Additively-manufactured, Robust, Tower-style) Urban Farming

Anselmo Klement Chua
RAFFLES INSTITUTION
Glycolysis and DNA Repair: Novel Roles of Pyruvate Kinase in the DNA Damage Response

Boyce Ang Kok Hong (Hong Guo Feng), Ng Yu Heng, Sun Zizhuo
HWA CHONG INSTITUTION
Optimised Numerical Methods for the Computation of Particles in Fusion Hotspots and Particle Interactions in Magnetised Liner Inertial Fusion (MagLIF)

Cai Junxiang, Aidan Ong
NATIONAL JUNIOR COLLEGE, HWA CHONG INSTITUTION
State Space Models Are All You Need

Chen Qingyuan, Ling Jun Quan
RIVER VALLEY HIGH SCHOOL, HWA CHONG INSTITUTION
Investigating the Effects of pH in the Rejection of Boron in Reverse Osmosis for Seawater Desalination

Galen Gay
NATIONAL JUNIOR COLLEGE
Assessment of the Umami Flavour of Commercial Meat and Plant-based Meat Analogues

Gan Kah Shuen
RAFFLES INSTITUTION
Yeast-based High-throughput Screening of Plasmodium falciparum Phosphodiesterase Beta (PDE β) for Malaria Drug Discovery

Gan Mingle Chloe
ANGLO CHINESE JUNIOR COLLEGE
Analysis of Differentially Expressed Genes in Sapotaceae Ripening

Ivan Joel You Wen Jie
NUS HIGH SCHOOL OF MATHEMATICS AND SCIENCE
Synergistic Combination of $Sb_2Si_2Te_6$ Additives in $Bi_{0.4}Sb_{1.6}Te_3$ for Enhanced Thermoelectric Waste Heat Harvesting

SSEF 2024 WINNERS

GOLD

Jack Low Ee Jin, Jiang Ruiyang

HWA CHONG INSTITUTION

Engineering Phase Transformation Behaviour in the 4D Printing of Ni-Ti Shape Memory Alloys

STEPS Ahead: Self-Powered Triboelectric Nanogenerator (TENG) for Dynamic Multidirectional Pressure Sensing

WU JIAQI

NUS HIGH SCHOOL OF MATHEMATICS AND SCIENCE

In this fast-paced world today, technologies such as human-machine interfaces and human motion monitoring are rapidly evolving. These advancements highlight the need for real-time pressure sensing technologies for accurate and interactive feedback systems. However, the challenge remains in mass-producibility due to the lack of a simple fabrication process, while still maintaining high sensitivity at the clinically relevant pressure range of 0 to 70 mmHg with real-time remote sensing capability.

To address these needs, we developed the self-powered triboelectric nanogenerator (TENG) based pressure sensor (STEPS). STEPs is meticulously designed as a three-layer sandwich structure, which can be easily made using solely parallel processes. By doping Carbon Black (CB) and Polyvinylpyrrolidone (PVP) at optimal percentages into the PDMS matrix, together with employing a unique three-dimensional morphology, we achieved an optimized surface charge density, leading to a high sensitivity of 2.61 ± 0.02 mV/mmHg with excellent linearity of R-square ≈ 0.996 , outperforming previous works.

Additionally, we developed a STEPs array and equipped it with a wireless system for multidirectional pressure sensing and real-time remote display of pressure readings. STEPs had demonstrated great reliability and accuracy in simulated trials, and we believe that this highly sensitive pressure sensor meets the demand in a wide range of applications, offering significant commercial potential in fields including the Internet of Things (IoT) and advanced biomedical technologies.

SMART (Sustainable, Modular, Additively-manufactured, Robust, Tower-style) Urban Farming

ANG GEDEON KUSUMA

RAFFLES INSTITUTION

Singapore faces food security and sustainability issues due to low (<10%) local produce, increased demand for food (50% by 2050) and little (1%) land allocated for agriculture. Only a very small 3.9% of local vegetables consumption is produced locally. Nutrient Film Technique (NFT) hydroponics is practical, but current solutions are inadequate due to space and maintenance constraints. In this project, a novel design of tower-style NFT hydroponics, that focuses on space efficiency, multifunctionality, intelligence, energy efficiency and material efficiency, is developed. Complex internal and exterior geometry, structures inspired by aircraft semi-monocoque fuselage, which are optimised in their dimensions, and analysis by finite element analysis (FEA) ensures the design is space efficient, material saving and strong (safety factors > 6 across all 3 loading conditions). Selective Laser Sintering (SLS), a Laser Bed Powder Fusion (LPBF) Additive Manufacturing (AM) process, is used to fabricate these complex geometries without support structures, with high isotropy; and with glass-bead filled polypropylene (PPGB).

This system is 3.3 to 9.8 times more space efficient; and 3.4 to 4.7 times more material efficient than existing NFT hydroponics systems. A more energy-efficient full-spectrum LED lighting solution is also developed. This system's high modularity allows different sizes and types of plants to be grown together. A low-cost system monitors and maintains critical variables for the system's operation. A 2-week test growth period shows expected plant growth. Hence, this system can be practically installed in (especially) indoor settings such as homes and offices, bringing Singapore closer to the 30-by-30 plan.

Precession, Nutation and Dynamic Trajectory of a Magnetic Rod in an Axisymmetric Magnetic Field

MARTIN KOH ZHEN XUAN
NUS HIGH SCHOOL OF MATHEMATICS AND SCIENCE

Precession and nutation in dynamical systems have been of long-standing research interest. Manifesting in systems as diverse as spinning tops to celestial bodies like planets, and understanding these motions offer a window into the intricate dance of forces governing such systems. One example of a previously unexplored system exhibiting precession and nutation is that of a magnetic rod in an axisymmetric magnetic field. This project aims to study this system through qualitative, quantitative, and experimental means. A theoretical model was formulated using Newton's Second Law and the torque equation, accounting for energy dissipation. One unique aspect of this system compared to other systems exhibiting precession and nutation is the presence of the non-linear magnetic force and torque, which were modelled by considering both magnets as current carrying cylinders. Experimentally, the dynamic trajectory and relevant degrees of freedom of the rod were measured using image binarization and ellipse fitting. This was used for a systematic investigation into how the nutation, precession and petaloid-like trajectories are affected by number of magnets, initial angular velocity and other relevant parameters. Theoretical predictions and experimental results show a good agreement. This work has various engineering applications such as centrifuge design, and could be used to introduce students to the concepts of precession, nutation and the magnetic force.

Atomically Yours: Novel DeepGraphDTI Takes Fight Against Future Pandemics to the Next Level

LIM WAN QIN
HWA CHONG INSTITUTION

The World Health Organisation's Blueprint Priority Disease Nipah Henipavirus' (NiV) deadly pandemic potential has been evidenced by outbreaks across the world. Its high mortality rates of up to 92% across Asia, South Pacific, and Australia renders it distressing as no approved vaccines and NiV-specific therapeutics exist to this date. Current in silico methods to discover a cure rely on molecular docking and dynamics which are computationally intensive and time-consuming. Hence, deep learning Drug-Target-Affinity (DTA) models, which are able to predict drug-target interactions within seconds, present an attractively accelerated approach to discover inhibitors, circumventing tedious protein and chemical environment preparations required for simulations. Present DTA architectures encode sequence-based protein residues for learning, often using Convolutional Neural Networks that neglect structural information. To greatly enhance the predictive prowess of DTA models, this study curates a novel Graph Neural Network model DeepGraphDTI, which builds graph representations of proteins from atomic-level properties, allowing high-resolution structural attributes to be extracted. Found to surpass the performances of existing state-of-the-art models, DeepGraphDTI proves itself a potent tool for diverse applications in drug discovery such as unearthing novel drugs against emerging pathogens. In this study, DeepGraphDTI was used to identify potential inhibitors against the NiV attachment and fusion glycoproteins from 1,040 drugs in the Global Health Priority Box, Pandemic Response Box and Pathogen Box, and molecular docking was carried out to further verify the predicted inhibitors. 7 promising drugs were thus selected for future in vitro and vivo experimental evaluation.

Haema-Lights: Facile method of Site-selective Synthesis of Fluorescent Ag-Fe₂O₃ Nanocomposites for Optical Electron Detection

YIN YUE, ASEERA JANNATH
RAFFLES INSTITUTION

Ag-Fe₂O₃ nanocomposites are powerful catalysts for the photocatalytic degradation of toxic industrial dyes and effective antimicrobial agents against fungi and bacteria, making them the subject of much interest. However, currently the chemically intensive, pollutive, hazardous, and expensive synthesis processes of Ag-Fe₂O₃ nanocomposites stand as a barrier to application. Traditional physical and chemical methods involve the usage of chemical reducing agents, high temperatures and pressure, while newer biological methods utilising microorganisms as reducing agents pose safety challenges due to the toxic nature of certain microorganisms and difficulties with incubation.

The first part of our project involved exploring a simple yet effective method for synthesising Ag-Fe₂O₃ nanocomposites. We grew Fe₂O₃ nanoflakes by "cooking" iron foil on a hotplate and doped them with silver through laser modification under AgNO₃ solution, allowing the nanocomposite to be formed without the use of any chemical reducing agent. The formation process is precise and composite characteristics like size and uniformity can be easily tuned by varying laser parameters. We also conducted morphology and composition characterisation using Scanning Electron Microscopy (SEM), Electron Diffraction X-ray spectroscopy (EDX), Transmission Electron Microscopy (TEM), Raman Spectroscopy, X-ray Photoelectron Spectroscopy (XPS), and proposed and verified a potential formation mechanism.

We also discovered that the Ag-Fe₂O₃ nanocomposite has fluorescent properties where our sample glows red under yellow light. Not only that, the fluorescence intensity of our material responded linearly to electron exposure, leading us to investigate its capabilities as an electron detector. Characterisation using XPS and TEM techniques allowed us to propose the mechanism for the nanocomposite's fluorescence change - electron-induced reduction! Finally, we showed that the sensor is spatially highly precise - easily up to 5 µm. We hope that its micro-scale size and inexpensive synthesis can make it a valuable complement to existing sensors.

State Space Models Are All You Need

CAI JUNXIANG, AIDAN ONG
NATIONAL JUNIOR COLLEGE,
HWA CHONG INSTITUTION

Our primary goal for this project was to make AI models for sequence modelling more efficient and accurate. We hold the view that pursuing more efficient and accurate sequence modelling can allow AI to be used in a wider range of scenarios. There has been a significant amount of impressive effort in scaling Transformers to longer sequences, however, many of them seem to encounter a trade-off with accuracy. To enable more efficient and accurate sequence modelling, we introduced two State Space Model (SSM)-based architectures - Liquid-S5 and LiquidMamba that both scale linearly with sequence length, instead of quadratically, like the Transformer. Liquid-S5 sets a state-of-the-art (SOTA) score on the industry-standard Long Range Arena benchmark, while LiquidMamba sets another SOTA score on the WikiText-103 benchmark at the parameter count of 125 million. In particular, both architectures exceeded the performance of the Transformer architecture. Given that our emphasis revolves around modelling progressively longer sequences more efficiently and accurately, we are particularly driven by applications that could gain advantages from these extended-sequence models, including high-resolution imaging, extremely long genomic sequences, and language models capable of comprehending entire books. We are confident that our contributions enhance the overall cost efficiency and accuracy of sequence modelling, potentially offering valuable contributions to scientific exploration.

National STEM Talent Search

By Science Centre Singapore

NATIONAL STEM TALENT SEARCH (NSTS)

BACKGROUND

The National STEM Talent Search (NSTS) is an annual competition by Science Centre Singapore with support from the Ministry of Education. Previously known as the A*STAR Talent Search, the competition was inaugurated in 1995 and is based on a concept similar to the Regeneron Science Talent Search in the USA. NSTS is a prestigious annual competition that aims to motivate and accord national recognition on students who excel in science and technology. Through NSTS, Singaporean students aged 15 to 21 years old are given a platform to showcase their projects and are encouraged to further their interest in science, technology, engineering, and mathematics (STEM).

NSTS participants are evolved from the winners of the Singapore Science & Engineering Fair (SSEF) 2024 after the first round of judging on their presentation of their submitted research projects for SSEF. NSTS participants then undergo two more rounds of selection by a panel of judges consisting of scientists from A*STAR, NEA, NTU, NUS, SIT and SUTD and chaired by a renowned local scientist.

NSTS winners need to display resourcefulness, mastery of scientific concepts, as well as passion for scientific research.

There are four scientific categories for NSTS 2024:

- Biomedical Science
- Computer Science & Mathematics
- Engineering
- Material Science

FOREWORD

Professor Phoon Kok Kwang

CHAIRPERSON, *National STEM Talent Search 2024 Awards Committee*

PROVOST, *Singapore University of Technology and Design*

We are honoured to have the distinguished Professor Ng Huck Hui as the chief judge for NSTS this year. Prof Ng is the Assistant Chief Executive for Research and Talent Development, and Chief Scientific Advisor of the Institute of Molecular and Cell Biology (IMCB), under the Agency for Science, Technology and Research. Professor Ng is renowned in the field of stem cells, having spent more than a decade in research to understand and uncover the intricacies of gene regulation and how they relate to cell biology.

Being a scientist can be a tremendously fulfilling and enlightening experience, even though the path to scientific discovery is frequently challenging. The best scientists are motivated to make the world a better place. We hope that the NSTS will encourage the next generation to keep growing as researchers and to see science as a meaningful pursuit.

This year, 69 registered participants demonstrated a high level of interest in NSTS. The Committee and I find it encouraging that our young students have led the way in such enthusiastic engagement across a wide range of sciences. In addition to the novelty of this year's ideas, the NSTS exemplifies the spirit of passion that characterizes our next generation of aspiring scientists.

Students have shown perseverance and commitment by accepting this challenge, and I would like to thank each and every one of them for participating in NSTS 2024. To the nine finalists: we are incredibly proud of how far you have come and your outstanding performance. I have no doubt that everyone who has taken part has grown personally and acquired useful knowledge and skills. I hope that it has been a rewarding experience.

I would want to thank everyone who has helped make NSTS a success, especially the NSTS Awards Committee and the Science Centre Singapore. My sincere gratitude also extends to the judges, mentors, principals, teachers, and parents who have given so much of their time and energy to nurture our young talents and to make this annual apex event a success.

Thank you.

Professor Phoon Kok Kwang

CHAIRPERSON, *National STEM Talent Search 2024 Awards Committee*

PROVOST, *Singapore University of Technology and Design*

NSTS 2024

FINALISTS

SMART (Sustainable, Modular, Additively-manufactured, Robust, Tower-style) Urban Farming

ANG GEDEON KUSUMA

RAFFLES INSTITUTION

CATEGORY : ENGINEERING

MENTOR : PROFESSOR SING SWEE LEONG

Singapore faces food security and sustainability issues from low (<10%) local produce, and little (1%) land allocated for agriculture. This project outlines the development of a novel design of tower-style nutrient film technique (NFT) hydroponics that focuses on space-efficiency, modularity, intelligence, energy-efficiency, and material-efficiency. Complex internal and exterior geometry inspired by aircraft semi-monocoque fuselage; optimisation and analysis by finite element analysis (FEA) ensures the design is space-efficient, material-saving, and strong (all safety factors>6). Selective laser sintering (SLS) is used for fabrication without support structures, with high isotropy. This system is 3.3-9.8x more space-efficient; and 3.4-4.7x more material-efficient than existing NFT systems. A more energy-efficient full-spectrum LED lighting solution, and a low-cost monitoring, maintenance and alert system is also developed. This system's high modularity allows different-sized plants to be grown together. Hence, this system can be practically installed in indoor settings (homes and offices), bringing Singapore closer to the 30-by-30 plan.

Chat, is this real? mm-Double Confirm! : A Multimodal Network for Singapore-context Misinformation Detection

FELICIA TAN EE SHAN

RAFFLES INSTITUTION

CATEGORY : COMPUTER SCIENCE & MATHEMATICS

MENTOR : MR ADRIEL KUEK YONG JIE

In today's digital age, misinformation demands innovative solutions. To address the lack of a fact-checking model for Singapore-specific multimodal misinformation (text and image), we propose a novel ensemble model that achieves strong performance across all functions. Our automated evidence retrieval framework, leveraging the H2-keywordextractor transformer and SBERT to query NewsAPI, ensures accuracy and practicality. Our CLIP Truthfulness Classifier, trained on a self-collected Singapore-context multimodal misinformation dataset, coupled with a parallel ChatGPT-4-32k system, achieves robust ~ 95% F1-scores. We developed an SBERT-based detector to evaluate satire based on language semantics, achieving a 93.2% F1-score. We verified that the COSMOS model is suitable for domain transfer. Lastly, we developed an explanation generation system by prompting optimised ChatGPT-4-32k, achieving high BLEU, METEOR and ROUGE scores of 0.841, 0.945 and 0.913 respectively. Our model addresses nuanced aspects of misinformation that are currently overlooked and achieves state-of-the-art performance for Singapore-specific multimodal misinformation.

Yeast-based High-throughput Screening of Plasmodium falciparum Phosphodiesterase Beta (PDE β) for Malaria Drug Discovery

GAN KAH SHUEN

RAFFLES INSTITUTION

CATEGORY : BIOMEDICAL SCIENCE
MENTOR : PROFESSOR CHARLES HOFFMAN

The emergence of drug-resistant Plasmodium falciparum parasite, which causes the most lethal malaria, poses a significant challenge to disease eradication efforts and necessitates the discovery of new drug targets. This study focuses on the cyclic nucleotide signalling pathway in P. falciparum, specifically, the action of enzyme phosphodiesterase beta (PfPDE β). PfPDE β catalyses the hydrolysis of intracellular second messenger 3',5'-cyclic adenosine monophosphate (cAMP), a key regulator of P. falciparum asexual blood stage development. I successfully cloned the PfPDE β gene and constructed Schizosaccharomyces pombe yeast strains expressing PfPDE β . A yeast-based high-throughput screen (HTS) was developed and optimised to identify PfPDE β inhibitors. 162 known mammalian phosphodiesterase (PDE) inhibitors were screened and the growth response of yeast strains expressing PfPDE β was analysed. Six hit compounds were identified as PfPDE β inhibitors. This study has successfully developed a chemical toolkit to assess the utility of PfPDE β as a drug target, advancing ongoing efforts in antimalarial drug development.

Dysregulation of Myelin-related Genes in NOTCH2NLC-associated Neurodegenerative Diseases

LIU YIMING

RAFFLES INSTITUTION

CATEGORY : BIOMEDICAL SCIENCE
MENTOR : DR ZENG LI, DR TU HAITAO

NOTCH2NLC-associated neurodegenerative diseases are a novel disease entity with heterogeneous clinical manifestations. Abnormally-expanded GGC repeats within the NOTCH2NLC gene were recently identified as its genetic mechanism. However, its underlying molecular mechanism is unclear. This study identifies and investigates the involvement of downstream cellular components in the pathogenesis of NOTCH2NLC-related neurodegenerative diseases. Bulk RNA-seq revealed differential gene expression, highlighting the significance of the cellular component myelin sheath. qPCR validation was conducted for representative myelin-related genes using transgenic mice and patient samples. With their general down-regulation in diseased samples, the most significant gene, MBP, was co-expressed with NOTCH2NLC constructs in SH-SY5Y cells to simulate the disease genotype; coupled with our transgenic mouse model, we demonstrate dependence of MBP protein levels on pathogenic GGC repeat expansions. Overall, the identification and validation of myelin-related differentially expressed genes like MBP may serve as biomarkers for diagnosis or potential drug targets in treating NOTCH2NLC-associated neurodegenerative diseases.

Precession, Nutation, and Dynamic Trajectory of a Magnetic Rod in an Axisymmetric Magnetic Field

MARTIN KOH ZHEN XUAN

NUS HIGH SCHOOL OF MATHEMATICS AND SCIENCE

CATEGORY : ENGINEERING
MENTOR : DR BERNARD RICARDO

Precession and nutation have been of long-standing research interest. Manifesting in dynamical systems ranging from spinning tops to planets, understanding these motions offer a window into the intricate dance of forces governing such systems. One example of a previously unexplored system exhibiting precession and nutation is that of a magnetic rod in an axisymmetric magnetic field. This project aims to study this system theoretically and experimentally. We modelled the non-linear magnetic interaction by considering both magnets as current cylinders. This was used in conjunction with Newton's Second Law and the torque equation, accounting for energy dissipation. Experimentally, the rod's relevant degrees of freedom were measured using image binarization and ellipse fitting. A systematic investigation into how precession, nutation and the petaloid-like trajectories are affected by rod length and other parameters was conducted. Theoretical predictions and experimental results show good agreement. This work has various engineering applications such as centrifuge design.

What's Under The Hood? Root Cause and Patch Analyses of Elevation of Privilege Vulnerabilities in the Windows Operating System

PAK TZE BIN BRYAN

RAFFLES INSTITUTION

CATEGORY : COMPUTER SCIENCE & MATHEMATICS
MENTOR : MS YAP NI

The Windows operating system is highly vulnerable to improper privilege management. This project focuses on three elevation of privilege CVEs. The objective is to analyse whether the patches comprehensively address the root causes of the vulnerabilities or merely mitigate specific methods of replication. The methodology uses static analysis tools like Ghidra, IDA and BinDiff, as well as dynamic analysis tools like ProcMon and WinDbg. Firstly, for root cause analysis, each vulnerability was replicated on a virtual machine, and its driver or executable was statically analysed, to identify its root cause. Next, patch analysis was conducted on the "patched" driver or executable and its virtual machine to evaluate if the patches are sufficient at fully mitigating the root cause of the vulnerability. The patches for CVE-2020-1170 and CVE-2021-21551 are unsuccessful as there are ways that attackers can bypass them. In contrast, CVE-2023-21768 exhibits successful patching that prevents elevation of privilege.

How Metabolic Enzymes TPI and GAPDH link Glycolysis and Cancer

VIVIENNE CHUA XUAN YU

CLEMENTI TOWN SECONDARY SCHOOL

CATEGORY : BIOMEDICAL SCIENCE
MENTOR : A/P NORBERT LEHMING

Human cancer cells, like yeast, ferment glucose to lactate (alcohol in yeast) generating energy, despite the presence of oxygen, or aerobic glycolysis. The Warburg effect correlates a cancer's aggressiveness with the ratio of aerobic glycolysis to respiration, oxidising glucose to CO₂. Aerobic glycolysis maintains most C-C bonds of glucose, but generates less energy, requiring it to operate at a higher frequency. Methylglyoxal, a toxic by-product of glycolysis, damages DNA. Cancer cells, like yeast, repair damaged DNA efficiently, making them resistant to radiotherapy. More research linking glycolysis and cancer can further develop chemotherapy which inhibits DNA repair using drugs. Modelling with yeast, DNA repair factor Rad9 was discovered to interact with TPI1 and GAPDH. We isolated DNA repair deficient TPI1 and GAPDH mutant strains. The TPI1 mutant lowered TPI enzymatic activity, suggesting methylglyoxal accumulation, while the GAPDH mutants' enzymatic activity remained normal, indicating that GAPDH moonlights in the DNA Damage Response.

Self-Powered Triboelectric Nanogenerator (TENG) for Dynamic Multidirectional Pressure Sensing

WU JIAQI

NUS HIGH SCHOOL OF MATHEMATICS AND SCIENCE

CATEGORY : ENGINEERING
MENTOR : DR ZHENG XINTING

Advancements in biomedical treatments and technological systems require effective real-time pressure sensing to provide smart feedback. However, developing a sensor that combines mass reproducibility and high sensitivity at clinically relevant pressure range has remained a significant obstacle. Herein, a self-powered triboelectric nanogenerator (TENG) based pressure sensor (STEPs) is proposed to meet these critical demands. STEPs introduces an innovative composite material, homogeneously blending Carbon Black (CB) and Polyvinylpyrrolidone (PVP) in Polydimethylsiloxane (PDMS) at optimal content ratio. Together with the unique three-dimensional structure, STEPs achieved enhanced surface charge density, leading to a high sensitivity of 2.61 mV/mmHg while following a much simpler fabrication process compared with previous works. A wireless system, established between a STEPs array and a readout device, further enables real-time remote display of multidirectional pressure readings. It is envisioned that STEPs is broadly applicable to many fields, with significant potential for commercialization in both human-machine interface and biomedical applications.

Haema-Lights: Laser Initiated Site-selective Formation of Ag-Fe₂O₃ Composites for Electron Detection

YIN YUE

RAFFLES INSTITUTION

CATEGORY : MATERIAL SCIENCE

MENTOR : PROFESSOR SOW CHORNG HAUR,
DR SHARON LIM

Ag-Fe₂O₃ nanocomposites are valued as powerful catalysts for the degradation of toxic industrial dyes and effective antimicrobial agents. However, the chemically intensive, pollutive, hazardous, and expensive synthesis processes of Ag-Fe₂O₃ nanocomposites stand as a barrier to application. This work first demonstrates a cheap, facile, yet effective method for synthesising Ag-Fe₂O₃ using a low-cost hotplate method of Fe₂O₃ nanoflake growth and incorporating Ag via laser modification under AgNO₃ solution, without the use of any chemical reducing agents. It is shown that the formation process is precise and composite characteristics laser tunable. Morphology and composition characterisation were conducted and we proposed and verified a potential formation mechanism. Further, the Ag-Fe₂O₃ nanocomposite has fluorescent properties which respond linearly to electron exposure. An electron-reduction based mechanism was proposed and verified for its fluorescence change. The sensor is spatially highly precise and may be applied in micro precision sensing and as an affordable wearable patch.

ACKNOWLEDGEMENTS

We would like to thank the following organisations that have contributed their domain experts to serve as judges for the Singapore Science and Engineering Fair 2024, and National STEM Talent Search 2024.

Agency for Science Technology and Research (A*STAR)
Amgen Singapore Manufacturing
DSO National Laboratories
GAG Engineering Services Pte Ltd
Gardens by the Bay
Health Sciences Authority (HSA)
Home Team Science and Technology Agency (HTX)
James Cook University
